## : Creating and Configuring a Maven Project

## Maven

Maven is a build automation and project management tool used in Java projects. It simplifies dependency management, builds processes, and project configuration using a standard POM (Project Object Model) file.

## Creating a New Maven Project

A Maven project named 'LibraryManagement' is created using an IDE like Eclipse or IntelliJ, or via the command line using Maven archetypes.

## Objective of the Exercise

The purpose of this exercise is to create a Maven project for the library management application and configure it with the necessary Spring dependencies and plugins.

## Output and Screenshots

```

1 <?xml version="1.0" encoding="UTF-8" ?>

## Summary Statement

This exercise highlights the process of setting up a Maven project from scratch, adding essential Spring dependencies, and configuring the project for Java development using Maven plugins.
